

# Aerostrat FE Tech Project

---

Welcome to the final Aerostrat tech round. This project is focused on frontend development and understanding your level of comfort building websites.

For this project, you can use any web technology you prefer. React, Vue, AngularJS, Vanilla - pick whatever you enjoy or are most comfortable with.

This project is less about your design skills and more about seeing your approach to building and laying out a website. Feel free to design it as you see fit - you will not be judged on your visual choices.

## Overview

---

Who doesn't like a good dad joke?

For this project, we're going to build a simple jokes website using <https://icanhazdadjoke.com>. The API and its documentation can be found here: <https://icanhazdadjoke.com/api>

## Core Requirements

---

- Be able to search for a joke
- Be able to retrieve a random joke
- Clicking on a joke should take you to a dedicated page for that joke (silly, we know)
- This site should have a header, footer, and navigation for accessing the pages you build

## Bonuses

- Track previous searches with persistence

- Expand on these requirements - they are minimums so feel free to go beyond and get creative

## **Project submission**

---

1. Push your code up to Github
2. Host it anywhere
3. Send us your hosted URL and a link to the github project
